Nvidia Gets $690BN, The Other 499 Get $340BN: Tracing Every Dollar Of 2027's AI Capex

英伟达获 6900 亿美元，其余 499 家公司获 3400 亿美元：追踪 2027 年人工智能资本支出的每一美元

BY TYLER DURDEN

MONDAY, OCT 19, 2026 - 05:00 AM

For much of the past year, the AI debate has had a strange hole in the middle of it.

过去一年中的大部分时间里，围绕人工智能的争论中间一直有个奇怪的空白。

Everyone knows how much the hyperscalers plan to spend (a number that only goes up), and everyone knows which stocks are supposed to benefit (a list that only gets longer). What almost nobody had done was connect the two: take the capex dollar, follow it through the supply chain, and see whose income statement it actually lands on. Or, as Morgan Stanley's equity strategy team puts it, **"AI revenue is rarely quantified."**

人人都知道超大规模云服务商计划投入多少资金（这个数字只会越来越高），也都知道哪些股票有望受益（名单只会越来越长）。但几乎没人把两者联系起来：从资本开支的每一美元出发，沿着供应链追踪，看看最终实际落入了谁的损益表。或者，正如摩根士丹利股票策略团队所说：“AI 收入很少得到量化。”

Not any more.

For the first time this week, Morgan Stanley put a hard number on the entire 2027 AI buildout: in a must read note titled "Following AI's $1.6 trillion Money Trail: Mapping the Revenue Generated by the Capex Boom" (*available to pro subs*), MS strategist Nick Lentini, Mike Wilson and about two dozen sector analysts map **$1.6 trillion of 2027 hyperscaler and neocloud capex** to single-stock revenue. It's a monster of a report, and readers of this weekend's Savone recap got a small taste of it.

本周，摩根士丹利首次为 2027 年整个 AI 建设周期给出了明确数字：在一份必读报告中，题为《追踪 AI 的 1.6 万亿美元资金流向：绘制资本开支热潮带来的营收图景》（仅面向专业订阅用户开放），摩根士丹利策略师 Nick Lentini、Mike Wilson 及约二十位行业分析师，将 2027 年超大规模云服务商和新兴云服务商的 1.6 万亿美元资本开支逐一对应到个股营收。这是一份分量十足的报告，本周末阅读 Savone 综述的读者已得以一窥其内容。

Here we go through the whole thing.

我们来把整件事梳理一遍。

The punchline first: **AI capex will directly drive ~25% of S&P 500 sales growth next year**, AI enablers and adopters will account for ***78% of 2027 earnings growth***, and to get to that $1.6 trillion headline MS had to go digging in the footnotes for **$195 billion of lease-financed spending** (which is off-balance sheet) that never shows up as capex on anyone's cash-flow statement.

先说结论：明年，AI 资本开支将直接推动标普 500 销售额增长的 25%；到 2027 年，AI 赋能企业和 AI 应用企业将贡献 78%的盈利增长。至于 1.6 万亿美元这一醒目的数字，摩根士丹利（MS）不得不翻查脚注，才找到 1950 亿美元由租赁融资的支出（不计入资产负债表）；这些支出从未作为资本开支出现在任何公司的现金流量表上。

Regular readers know why we care. We have been warning since last October that the AI buildout is a debt story first and a technology story second, and back on Oct 13 we summarized the whole chain in one tweet:

老读者都知道我们为何关注此事。自去年 10 月以来，我们一直警告称，AI 建设热潮首先是一个债务故事，其次才是技术故事。10 月 13 日，我们曾用一条推文概括了这条完整链条：

> Just how full is the hyperscaler/AI IG debt pipeline: there have been szero deals since the start of September. And SPVs not doing better. As a reminder, debt becomes capex, becomes revenue, becomes EPS. Without debt, there is no EPS growth.
>
> 超大规模云服务商/AI 投资级债务发行管线究竟有多充足：自 9 月初以来，零笔交易。特殊目的载体（SPV）的情况也好不到哪儿去。提醒一下：债务转化为资本开支，资本开支转化为收入，收入转化为每股收益。没有债务，就没有每股收益增长。
>
> — zerohedge (@zerohedge) October 13, 2026
>
> — zerohedge (@zerohedge)，2026 年 10 月 13 日

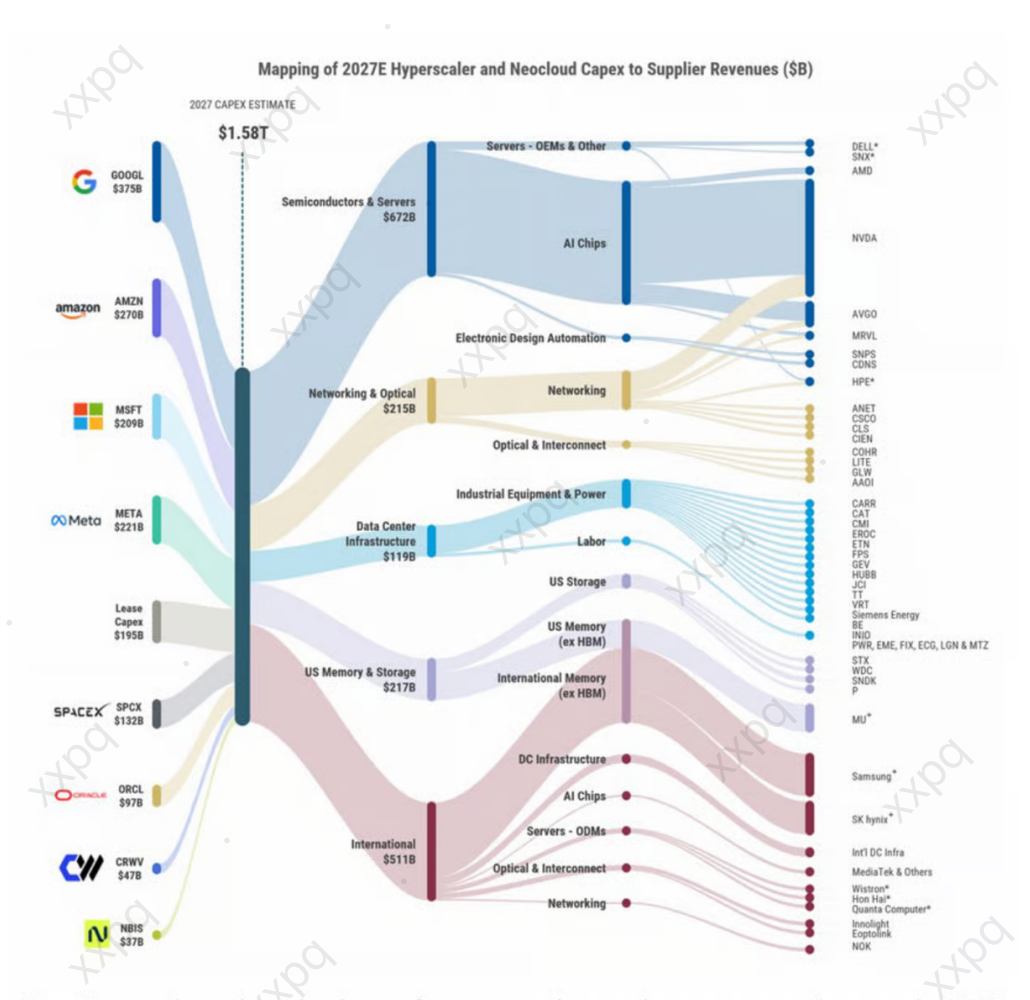
Morgan Stanley has now quantified the last three links of that chain. Let's walk through them, then get to the first one, which is where it gets uncomfortable.

摩根士丹利如今已量化这条链条的后三个环节。我们先逐一梳理，再谈第一个环节——这才是真正令人不安的地方。

The Map

The chart below is the centerpiece of the report: a Sankey diagram that takes $1.58 trillion of 2027 spending by nine buyers (Alphabet, Amazon's AWS, Microsoft, Meta, the lease bucket, SpaceX, Oracle, CoreWeave and Nebius) and routes it through semis and servers, networking and optical, data center infrastructure, US memory and storage and international suppliers, all the way to individual tickers.

下图是报告的核心：一张桑基图，追踪九家买方（Alphabet、亚马逊 AWS、微软、Meta、租赁类别、SpaceX、甲骨文、CoreWeave 和 Nebius）2027 年总计 1.58 万亿美元的支出，展示资金如何流向半导体与服务器、网络与光通信、数据中心基础设施、美国存储器与存储设备以及国际供应商，最终细分至各个股票代码。



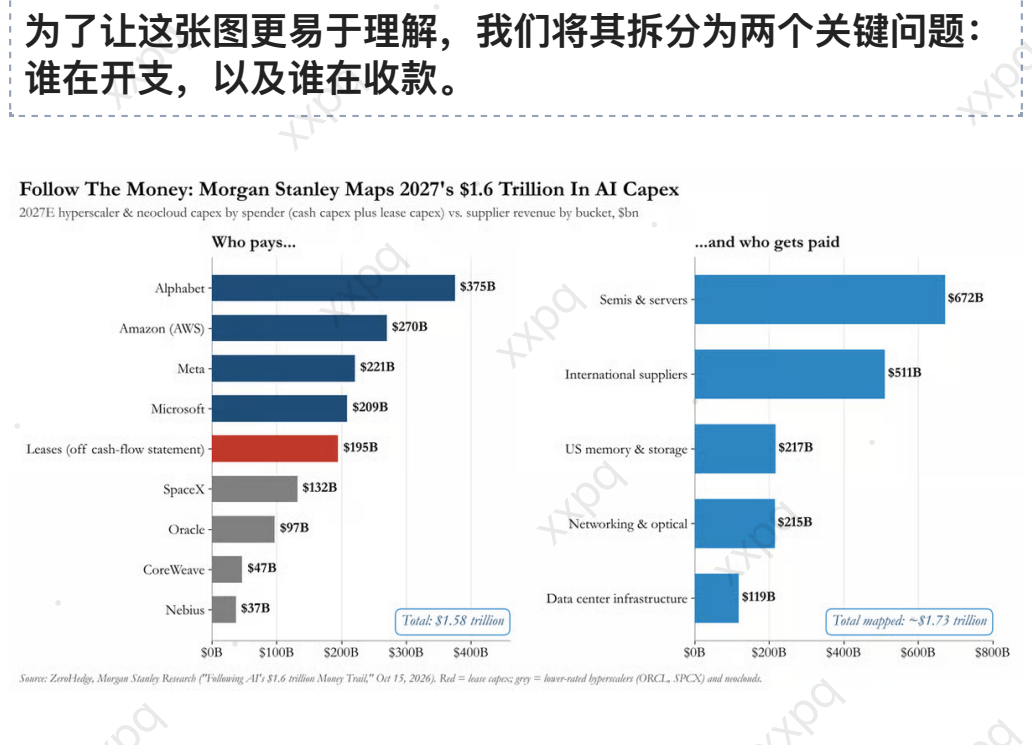
Note: Hyperscaler and neocloud capex figures are cash capex, leases aggregated separately, SPCX inclusive of estimated terafab capex, AMZN AWS capex only. *Includes only gross profit for OEMs and ODMs to capture assembly portion of hyperscaler/neocloud capex - semiconductors and other components included in revenue for those suppliers. +Excludes $30bn of HBM memory sales from MU, $57bn of HBM from Samsung, and $49bn HBM from SK Hynix sold into accelerators to avoid double counting revenues captured in AI chips. Source: Morgan Stanley Research

A few things jump out. **Semis and servers swallow $672 billion**, by far the biggest bucket, and most of that goes into one fat blue line labeled ***NVDA***. The second-largest bucket at **$511 billion is "International"**, i.e., Samsung, SK hynix, TSMC-adjacent infrastructure and the Taiwan ODMs, none of which are in the S&P. And the whole thing maps $1.6 trillion of capex to about $1.7 trillion of supplier revenue, a gap MS attributes to private neoclouds and bitcoin miners muddying the customer split, timing differences, and **supplier price increases that haven't made it into capex estimates yet**. Translation: *the next capex revision (undoubtedly higher) is already baked into supplier models*.

有几点十分醒目。半导体和服务器吞下了 6,720 亿美元，远超其他类别，其中大部分流向一条粗壮的蓝色柱线——标注为 NVDA。第二大类别是“国际”，规模达 5,110 亿美元，也就是三星、SK 海力士、台积电相关基础设施以及台湾 ODM 厂商；它们都不属于标普 500 指数。整体来看，这张图把 1.6 万亿美元的资本开支对应到约 1.7 万亿美元的供应商收入。摩根士丹利（MS）将差额归因于私人新云服务商和比特币矿工令客户构成难以厘清、时点差异，以及供应商涨价尚未反映在资本开支估算中。换言之，供应商模型已经计入下一轮资本开支上修（无疑是上调）。

To make it a bit more digestible, we split the map into the two questions that matter: who writes the checks, and who cashes them.

为了让这张图更易于理解，我们将其拆分为两个关键问题：谁在开支，以及谁在收款。



Note the red bar. The fifth-largest "spender" on the list isn't a company at all.

注意红色柱。榜单上第五大“支出方”根本不是一家公司。

"Leases Are Synthetic Capex"

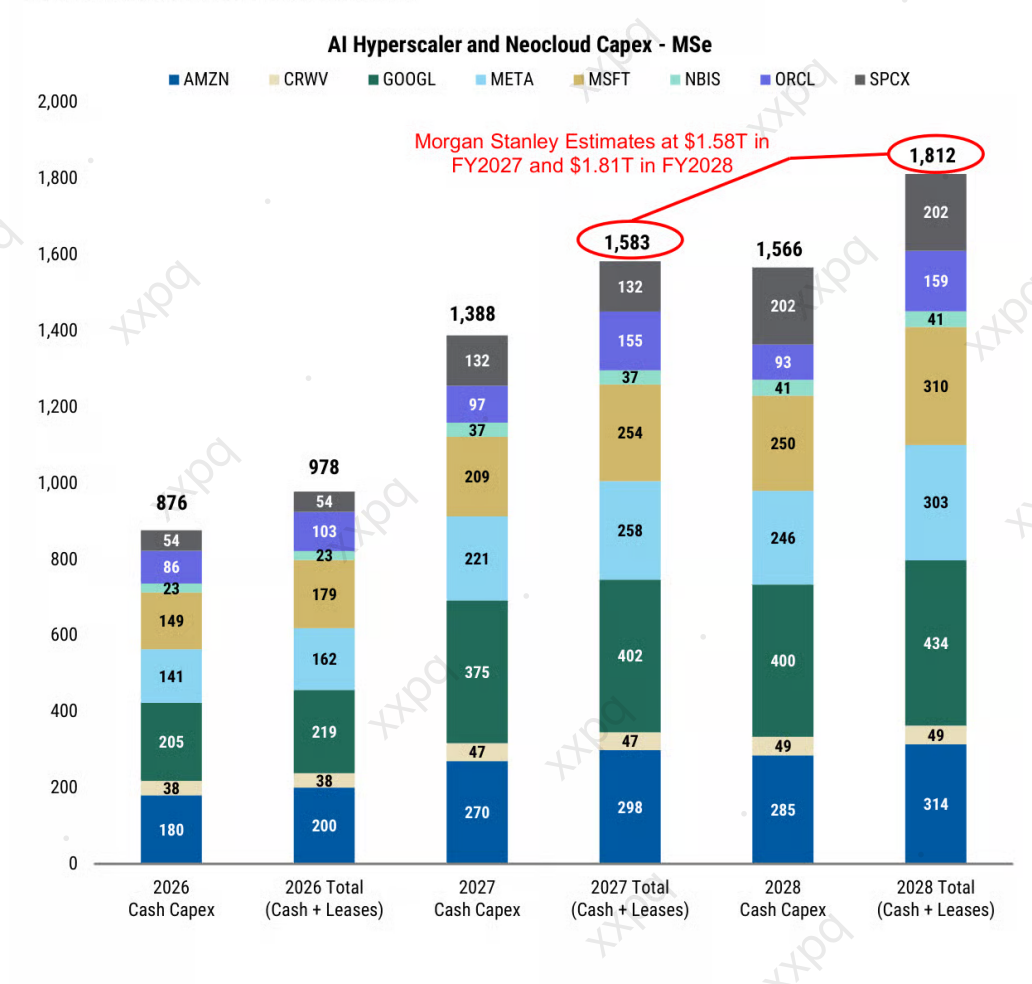
“租赁是合成资本开支”

更多一手研报请加微信：FCCNN88

MS's headline revision is its new lease model, and it is a big one. Using company-disclosed leases signed but not yet started, analyst estimates of capacity additions and the ratio of lease capex per GW added, the bank adds **$195 billion to 2027 capex and $246 billion to 2028**. That lifts total AI capex from $1.39 trillion in cash capex to **$1.58 trillion in 2027 (+~60% YoY)** and from $1.57 trillion to **$1.81 trillion in 2028**, after roughly doubling to $978 billion this year.

摩根士丹利（MS）此次上修的核心是其全新的租赁模型，幅度相当可观。该行根据公司披露的已签署但尚未开始履行的租赁协议、分析师对新增产能的估算，以及每新增 1 吉瓦产能对应的租赁资本开支比例，将 2027 年资本开支上调 1,950 亿美元，将 2028 年上调 2,460 亿美元。由此，人工智能资本支出总额从现金资本开支口径的 1.39 万亿美元升至 2027 年的 1.58 万亿美元（同比增长约 60%）；2028 年则从 1.57 万亿美元升至 1.81 万亿美元。此前，今年的资本开支将近翻倍至 9,780 亿美元。

Exhibit 1: We add Hyperscaler Operating Leases to Capex Estimates to get to $1.58T FY2027 and $1.81T FY2028 Capex



Source: Morgan Stanley Estimates

Why add them at all? Because, as MS explains, **leased data centers are economically the same thing as debt-funded capex**, they just bypass the GAAP capex line:

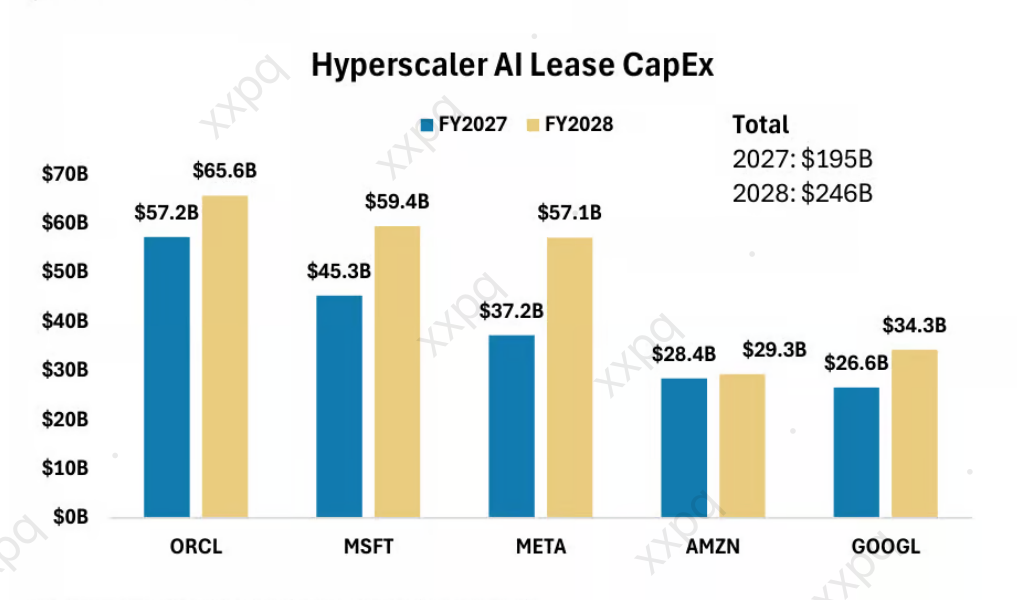
为什么要把这些纳入其中？正如摩根士丹利（MS）所解释的，租赁数据中心在经济实质上与债务融资的资本开支并无二致，只是绕开了美国通用会计准则（GAAP）下的资本开支项目：

> Capex forecasts are increasingly not telling the whole story as data center leases generally do not show up in analyst capex forecasts or management capex guidance. **Hyperscalers disclose commitments to pay more than $1.1T for leases that have not yet started.**
>
> 资本开支预测越来越无法反映全貌，因为数据中心租赁通常不会计入分析师的资本开支预测或管理层的资本开支指引。超大规模云服务商披露，承诺为尚未开始的租赁支付超过 1.1 万亿美元。

Oracle leads the lease pack at $57 billion next year, followed by Microsoft ($45 billion), Meta ($37 billion), Amazon ($28 billion) and Alphabet ($27 billion). And the pipeline of leases signed but not yet commenced has exploded to **$1.118 trillion as of 2Q26**, more than doubling in just two quarters, with Microsoft ($329 billion), Oracle ($288 billion) and Meta ($279 billion) doing most of the signing.

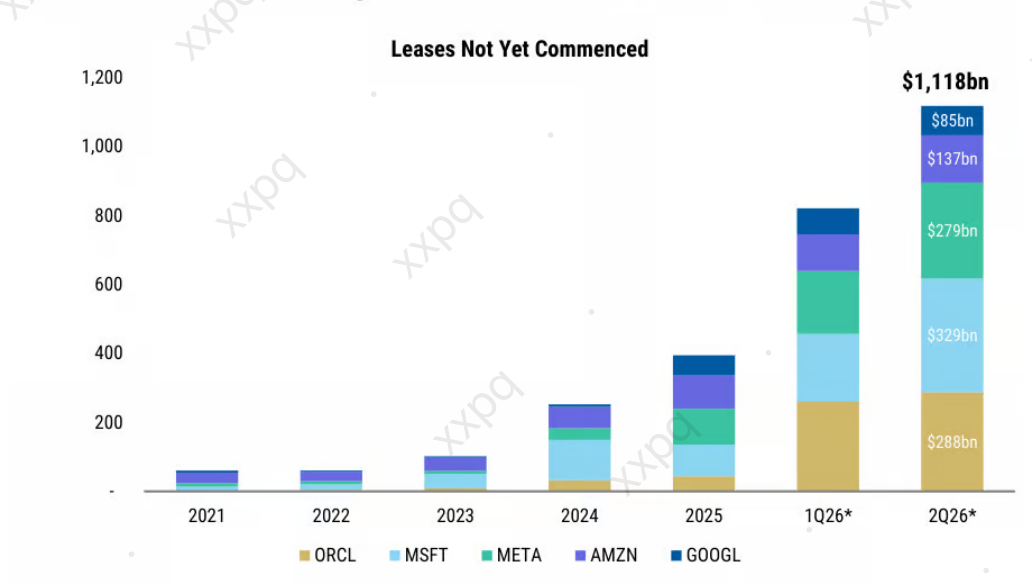
明年，甲骨文的租赁承诺金额将以 570 亿美元居首，其次是微软（450 亿美元）、Meta（370 亿美元）、亚马逊（280 亿美元）和 Alphabet（270 亿美元）。截至 2026 年第二季度末，已签署但尚未开始履行的租赁合同金额已飙升至 1.118 万亿美元，仅两个季度就翻了一倍以上，其中大部分由微软（3290 亿美元）、甲骨文（2880 亿美元）和 Meta（2790 亿美元）签署。

Exhibit 2: We Calculate Lease CapEx at $195B in FY2027 and $246B in FY2028



Source: Company Filings and Morgan Stanley Research.
Note: MSFT and ORCL quarters aligned to most recent fiscal year

Exhibit 3: Leases Signed Not Yet Commenced



Source: Company Filings and Morgan Stanley Research.
Note: ORCL most recent two quarters aligned to Q1 and Q2 2026

Readers who have been with us for a while will find this very familiar. Earlier this month we showed that once you count Meta's $628 billion "footnote", the stock gets 35% more expensive, and our running tracker of hyperscaler off-balance sheet liabilities hit a number that makes MS's $1.1 trillion look modest:

一直关注我们的读者对此会感到非常熟悉。本月早些时候我们指出，若将 Meta 那条价值 6280 亿美元的“脚注”计入，Meta 股票的估值就会贵出 35%；而我们持续追踪的超大规模云服务商表外负债规模，已达到一个令微软的 1.1 万亿美元相形见绌的数字：

> Our tracker of hyperscaler off balance sheet liabilities shows $3.8 trillion as of Sept 30, up $700BN from June 30. Adding $250BN in hyperscaler IG debt, the DV01 issued by the AI ecosystem in Q3 was about 25% higher than all Treasury issuance That's why yields keep rising
>
> 我们的超大规模云服务商表外负债追踪数据显示，截至 9 月 30 日，相关负债达 3.8 万亿美元，较 6 月 30 日增加 7000 亿美元。再加上超大规模云服务商 2500 亿美元的投资级债务，AI 生态系统在第三季度发行债券所对应的 DV01 约比同期美国国债发行总量高出 25%。这就是收益率持续攀升的原因。

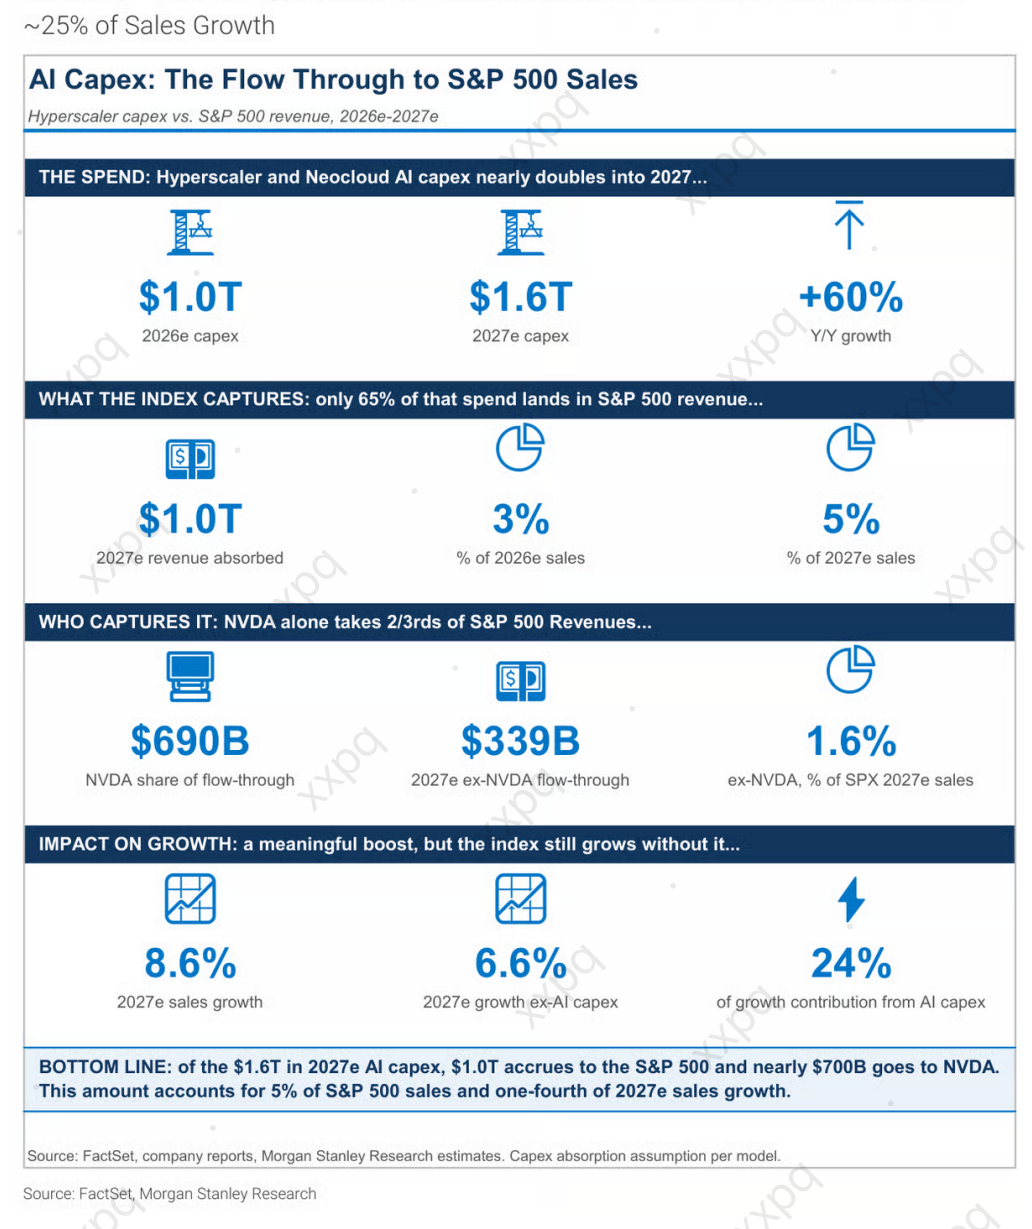
Nvidia Gets $690 Billion, The Other 499 Split $339 Billion

英伟达获得 6900 亿美元，其余 499 家公司合计分得 3390 亿美元

Now for the flow-through. MS estimates that **~65% of hyperscaler/neocloud capex is absorbed by S&P 500 companies**, which works out to just over $1 trillion of 2027 revenue, or ~5% of total index sales. That spending lifts S&P sales growth from a respectable 6.6% to **8.6%**, meaning **AI capex accounts for 24% of all 2027 sales growth** (up from 15% this year).

再来看这些支出的传导效应。摩根士丹利估计，超大规模云服务商/新兴云服务商资本支出的~65%由标普 500 指数成分股公司承接，折合 2027 年略高于 1 万亿美元的营收，相当于指数总销售额的~5%。这笔支出将标普 500 指数销售额增速从尚可的 6.6%推升至 8.6%，这意味着 AI 资本支出贡献了 2027 年全部销售额增长的 24%（高于今年的 15%）。

Exhibit 5: $1.6T in Hyperscaler and Neocloud Capex Drives 5% of 2027 Sales and ~25% of Sales Growth



AI Capex: The Flow Through to S&P 500 Sales
Hyperscaler capex vs. S&P 500 revenue, 2026e-2027e

THE SPEND: Hyperscaler and Neocloud AI capex nearly doubles into 2027...

$1.0T 2026e capex	**$1.6T** 2027e capex	**+60%** Y/Y growth

WHAT THE INDEX CAPTURES: only 65% of that spend lands in S&P 500 revenue...

$1.0T 2027e revenue absorbed	**3%** % of 2026e sales	**5%** % of 2027e sales

WHO CAPTURES IT: NVDA alone takes 2/3rds of S&P 500 Revenues...

$690B NVDA share of flow-through	**$339B** 2027e ex-NVDA flow-through	**1.6%** ex-NVDA, % of SPX 2027e sales

IMPACT ON GROWTH: a meaningful boost, but the index still grows without it...

8.6% 2027e sales growth	**6.6%** 2027e growth ex-AI capex	**24%** of growth contribution from AI capex

BOTTOM LINE: of the $1.6T in 2027e AI capex, $1.0T accrues to the S&P 500 and nearly $700B goes to NVDA. This amount accounts for 5% of S&P 500 sales and one-fourth of 2027e sales growth.

Source: FactSet, company reports, Morgan Stanley Research estimates. Capex absorption assumption per model.

Source: FactSet, Morgan Stanley Research

And then there is the line that should make every "AI is lifting all boats" bull pause: of the $1.03 trillion the index absorbs, ***67% goes to Nvidia***. That's about $690 billion, or ~44% of the entire $1.58 trillion capex budget, landing on one company's income statement. **Strip out NVDA, and the whole AI capex boom is worth just 1.6% of S&P 500 sales.**

还有一句话，足以让所有认为“AI 让各方都受益”的多头停下来想一想：在指数承接的 1.03 万亿美元中，67%流向英伟达。这约为 6900 亿美元，占 1.58 万亿美元资本支出预算的~44%，最终计入一家公司的利润表。剔除英伟达后，AI 资本支出热潮对标普 500 指数销售额的贡献仅为 1.6%。

Napkin math on the rest: roughly $0.7 trillion to Jensen, about $0.34 trillion to the other 499 S&P names combined, and the remaining ~$0.55 trillion leaks out of the index entirely, to Korean memory makers, Taiwanese ODMs and assorted private players. Which, incidentally, is also why the KOSPI just had the kind of week it had.

粗略估算其余部分：约 0.7 万亿美元流向黄仁勋，约 0.34 万亿美元由标普 500 指数其余 499 家公司合计获得；剩余的~0.55 万亿美元则完全流出指数，流向韩国存储芯片制造商、台湾 ODM 厂商及各类非上市公司。顺带一提，这也解释了为何韩国综合股价指数（KOSPI）刚刚经历了那样的一周。

MS's own framing of the 6.6% ex-AI growth is that the index "still grows without it," and the bank leans on this as evidence that broadening is "fully underway." Fair enough, probably. But as we noted when Micron and Nvidia alone were set to deliver a third of Q3 earnings growth, broadening is a tough sell when the median stock barely grows.

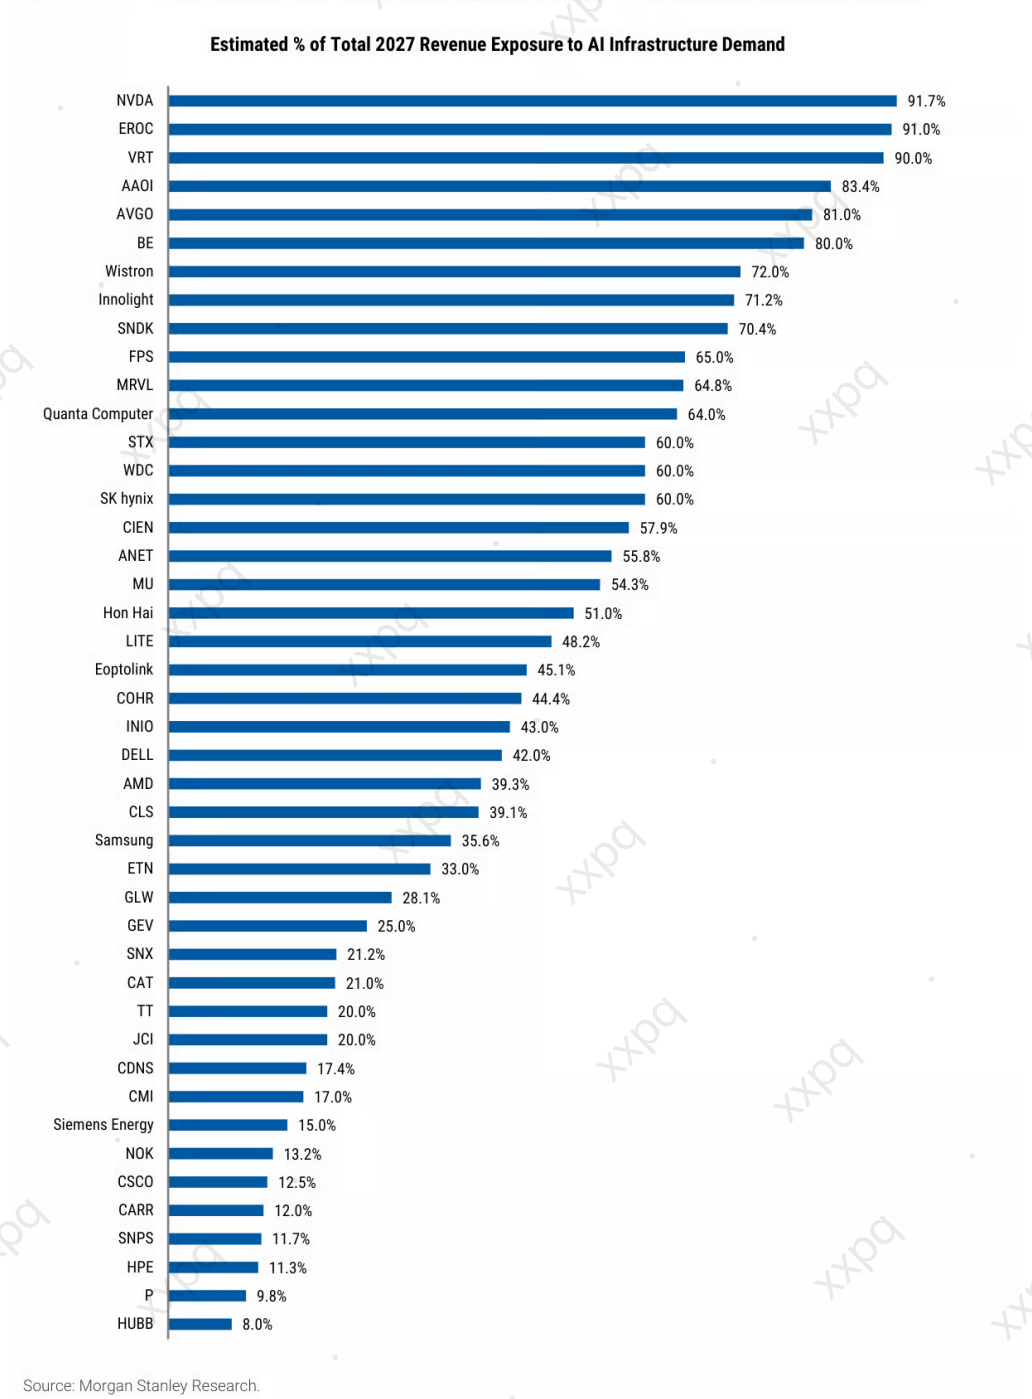
摩根士丹利对剔除 AI 后的 6.6%增速的表述是，指数“没有 AI 也能继续增长”，该行并以此作为增长面拓宽“已全面展开”的证据。说得通，或许如此。但正如我们此前指出的，单是美光和英伟达就将贡献第三季度盈利增长的三分之一；当中位数股票几乎没有增长时，要说增长面正在拓宽并不容易。

Who Is Most Exposed 哪些公司受影响最大

For the stock pickers, MS surveyed its sector analysts on how much of each company's 2027 revenue is tied to the AI infrastructure build. Nvidia tops the list at **91.7%**, but it has company: Erock (EROC) at 91%, Vertiv (VRT) at 90%, Applied Opto (AAOI) at 83%, Broadcom (AVGO) at 81% and Bloom Energy (BE) at 80%. Even Caterpillar (CAT) gets 21% of revenue from the AI capex trend, and Seagate (STX) and Western Digital (WDC) are both at 60%.

对于选股者而言，摩根士丹利（MS）调查了其行业分析师，了解各家公司 2027 年收入中有多少与 AI 基础设施建设相关。英伟达以 91.7%位居榜首，但并非独占鳌头：Erock（EROC）为 91%，Vertiv（VRT）为 90%，Applied Opto（AAOI）为 83%，博通（AVGO）为 81%，Bloom Energy（BE）为 80%。即使是卡特彼勒（CAT），也有 21%的收入受益于 AI 资本支出趋势；希捷（STX）和西部数据（WDC）则均为 60%。

Exhibit 4: Estimated 2027 Revenue Exposure to AI Infrastructure Capex Trend



Source: Morgan Stanley Research.

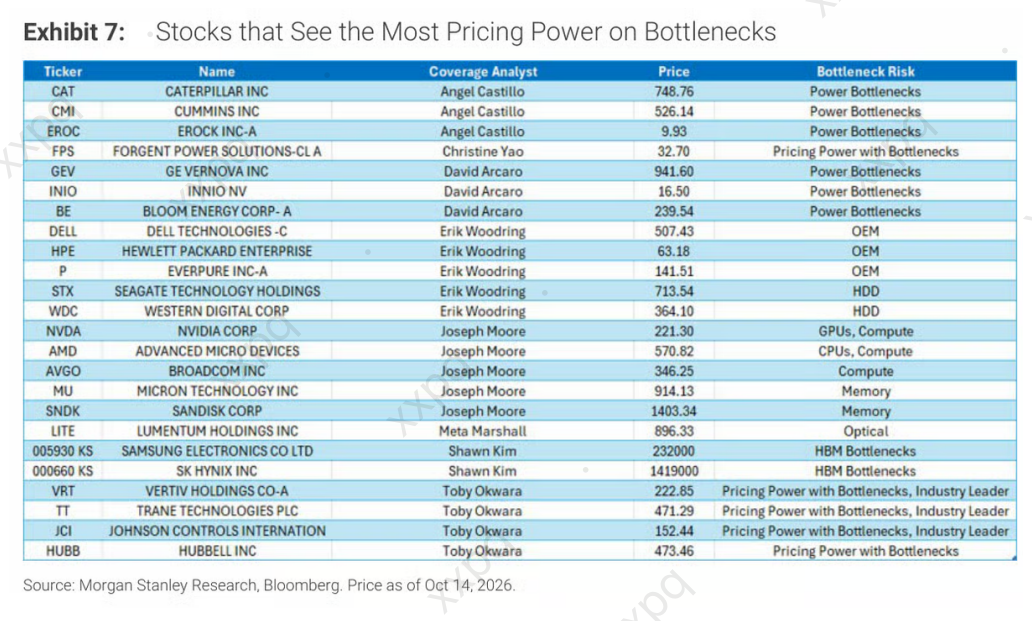
Put differently, **there are now at least a dozen large companies for which "AI capex" and "revenue" are basically synonyms**. That's great on the way up. On the way down, it means a capex revision is an earnings revision, with no other business to cushion it.

换句话说，如今至少有十几家大型公司，“AI 资本支出”和“收入”基本上已成同义词。这在上行阶段固然是好事；但在下行阶段，这意味着资本支出预期一旦下修，盈利预期也会随之下修，且没有其他业务可以缓冲冲击。

With capex growth set to slow from +60% in 2027 to +14% in 2028, MS also screened for the names with the most pricing power from current and future bottlenecks, i.e., those that should keep getting upward revisions even when capex revisions moderate. Power names (CAT, CMI, EROC, GEV, INIO, BE) dominate, along with memory, HDDs and the cooling trio of VRT, TT and JCI. It is a veritable who is who of the "***bottleneck bros.***"

随着资本支出增速预计将从 2027 年的+60%放缓至 2028 年的+14%，MS 还筛选了那些凭借当前及未来瓶颈拥有最大定价权的公司，也就是即使资本支出预期调整趋缓，它们仍有望持续获得上调预期的公司。电力相关公司（CAT、CMI、EROC、GEV、INIO、BE）占据主导地位，此外还有存储器、硬盘驱动器（HDD），以及冷却设备“三巨头”VRT、TT 和 JCI。这可谓是“瓶颈兄弟”阵营中的全明星名单。

Exhibit 7: Stocks that See the Most Pricing Power on Bottlenecks



Ticker	Name	Coverage Analyst	Price	Bottleneck Risk
CAT	CATERPILLAR INC	Angel Castillo	748.76	Power Bottlenecks
CMI	CUMMINS INC	Angel Castillo	526.14	Power Bottlenecks
EROC	EROCK INC-A	Angel Castillo	9.93	Power Bottlenecks

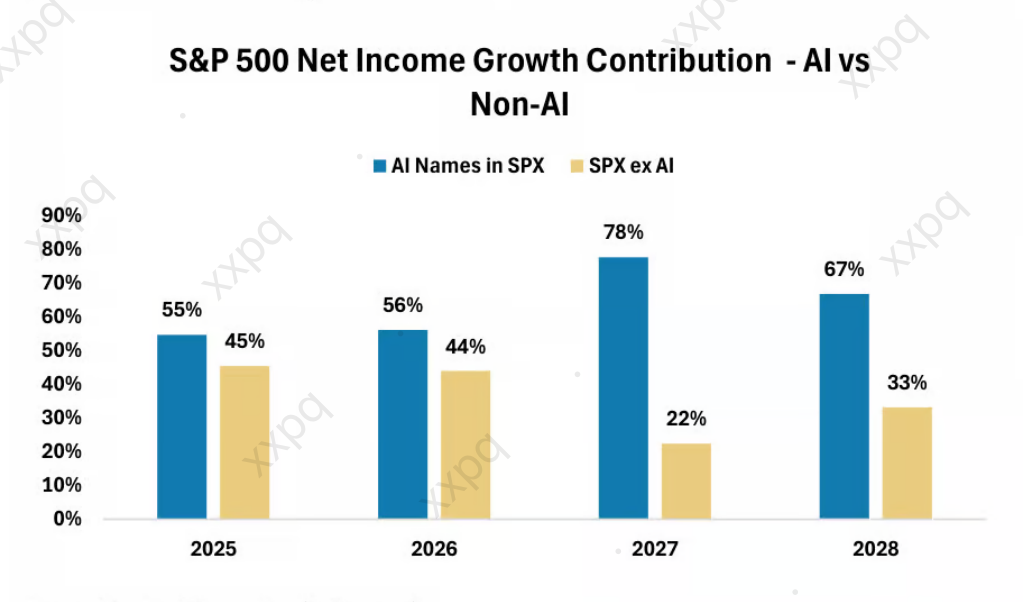
78% Of Next Year's Earnings Growth Rides On One Theme

明年 78%的盈利增长都押注于单一主题

MS also ran the numbers a second way, looking at the 42 S&P names classified as "Core to Thesis" AI enablers or adopters. Those companies are growing 2027 sales at 28% vs. 5% for everyone else, and earnings at 25% vs. 4%. The result: **the AI cohort will account for 78% of S&P 500 earnings growth in 2027**, while making up 37% of index net income (with the Mag 7 contributing about three-quarters of the cohort's earnings).

MS 还从另一个角度进行了测算，考察了 42 家标普成分股，这些公司被归类为 AI“核心受益者”或“核心采用者”。这些公司 2027 年销售额增长率为 28%，而其他所有公司的平均水平为 5%；盈利增长率为 25%，而其他公司的平均水平为 4%。结果是：2027 年，AI 公司群体将贡献标普 500 指数盈利增量的 78%，其净利润占指数总额的 37%（其中“美股七巨头”贡献了该群体约四分之三的盈利）。

Exhibit 12: Earnings Growth Contribution

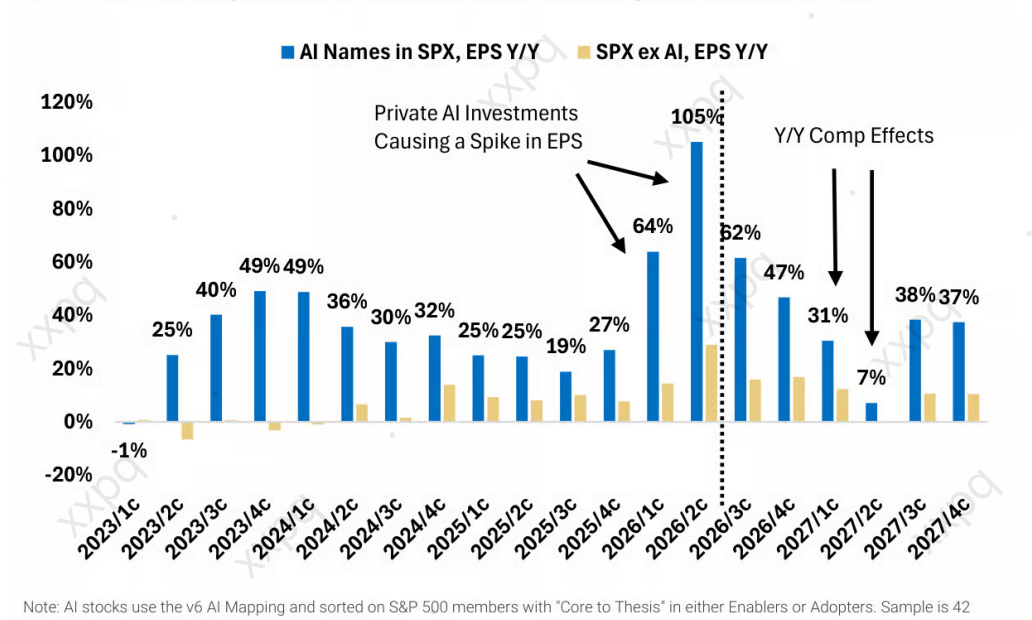


Source: FactSet, Morgan Stanley Research

Two caveats from the bank itself are worth flagging. First, the ex-AI cohort's anemic 4% earnings growth is partly a base effect after 23% growth this year. Second, and more interesting, the AI cohort's EPS growth peaked at 105% in 2Q26, with MS noting that **private AI investments showing up in non-operating profit skewed the 1Q, 2Q and full-year 2026 earnings picture**.

该行本身提出了两点值得注意。第一，非 AI 组仅 4% 的疲弱盈利增长，部分是受基数效应影响，此前该组今年增长了 23%。第二，也是更有意思的一点，AI 组的 EPS 增速在 2Q26 达到 105% 的峰值；MS 指出，计入非经营利润的私人 AI 投资收益，扭曲了 1Q、2Q 及 2026 全年的盈利表现。

Exhibit 8: Earnings from AI Companies are Outpacing the Rest of the Index



Note: AI stocks use the v6 AI Mapping and sorted on S&P 500 members with "Core to Thesis" in either Enablers or Adopters. Sample is 42 names. Source: FactSet, Morgan Stanley Research

In other words, part of this year's AI earnings "boom" was hyperscalers marking up their stakes in private AI labs. That is a great trick until the marks go the other way, as they did this week when Anthropic IPO investors marked the valuation down to $1.5 trillion.

换句话说，今年 AI 盈利的部分“繁荣”源于超大规模云服务商上调其在私人 AI 实验室中的持股估值。这招在估值不会反向变动时很奏效——但本周 Anthropic IPO 投资者将估值下调至 1.5 万亿美元，就说明情况并非总是如此。
